

News from Macs/Marill

Your Team from Animal Protection

You have made it possible that we could give Macs/Marill again in a costly examination. Our thanks for that!

The results are now in: He has a few more problems besides his hind legs. He has a chronic inflammation of the intestines (IBD) and at the moment a bladder infection that has already occurred several times (the cause is being investigated). At the moment everything also points to a (secondary) kidney dysfunction.

However, he is in the very best hands. Everything humanly possible is being done to give him a symptom-free life.

By the way. During the colonoscopy, the following items were flushed out of his appendix and rectum: absorbent cotton, gauze, plastic, stones, webbing and similar foreign objects! How long this poor guy must have suffered from hunger before he came to us at the shelter.

Sad, very sad.

Macs/Marill after gastrointestinall play
